

TO CHANGE LM1 PM FROM 4ohms to 8 ohms impedence

All LM1 PM's manufactured after July 1986 will have 3 link wires (straps) repositioned on the outside of the circuit board for changing the unit from 4 ohms to 8 ohms use .See attached drawing for positions.

On earlier LM1 PM's it will be necessary to remove the board from the chassis and add a 4ohms & 20ohms resistor (see drawing) so that the change can be made. The link (strap) wires are in these earlier models on the underside of the board and should be changed as indicated.
