

S2 line extended into the cone of the driver instead of using a throat chamber.

This line represents the app. average point of emanation from the back side of the cone. Could it be located more precisely?

Shortened S4 line that reflects the volume (area) displaced by the driver.

It take a little work to get these areas correct.

This is obviously wrong, but does it matter, and what would be "perfect"?

Shortest distance, narrowest horn path.
