

## Voice Coil Placing Guide

Suppose Top Plate thickness is 9 mm & the voice coil length is 20 mm  
then the overhang will be  
 $20 - 9 = 11/2 = 5.5 \text{ mm}$

Voice coil

Insert the voice coil to achieve this overhang :-

If you have assembled the speaker test linearity in this fashion

- 1) Connect a 9 v battery in phase & measure the displacement
- 2) Reverse the phase of the battery & check the displacement

It should be more or less equal if all is ok , you will need to make a test rig ,

**with lego & a sliding ruler or something**
