

# A Basic Guitar Amplifier Using the Hitachi HA13118

## Part 2

After soldering the board, a quick assembly of power supply and speaker was tested.

I used clamps to hold the boards in place then drilled pilot holes. When all the pilot holes were drilled I used screws to hold the boards together permanently.

The box is shown front side down. The speaker will be dropped in from the front. On the front piece you can see the rough edges from the saw blade that I kept to the inside of the box. Strips of wood recessed about  $\frac{1}{2}$  inch in from the back of the box are used for mounting the back plate.
