BOM for one half bridge SystemD_2k4 V1.3
Open Design by ChocoHolic
Safety Warning: Circuit operates at high voltages. Lethal injury possible. Only for skilled persons!
Please note: This is an DIY project for advanced enthusiasts. No warranties.
Rated power of one half bridge: 1200W into 2 R
Rated power of two half bridges in bridged mode: 2400W into 4R
The project requires an advanced level of know how.

| Ref | Value | Tolerance | El. min. requirements | Footprint | Type/Style | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| C201 | 47p |  | 16V | 8X5 RM5 | MKP, FKP | Any other film or foil type will work, but less premium |
| C202 | 47p |  | 16 V | 8X5 RM5 | MKP, FKP | Any other film or foil type will work, but less premium |
| C203 | 470pF |  | 16V | SM0805 | NPO / COG | X7R will work, but less premium |
| C204 | 470pF |  | 16 V | SM0805 | NPO / COG | X7R will work, but less premium |
| C205 | 1uF |  | 25 V | SM0805 | X7R | Anything between 100nF...1uF should work |
| C206 | 1uF |  | 25 V | SM0805 | X7R | Anything between 100nF...1uF should work |
| C207 | NIP |  | 16 V | 8x7 RM5 | MKP, FKP | Any other film or foil type will work, but less premium |
| C208 | Jumper |  | 16V | 8 x 7 RM5 | MKP, FKP | Any other film or foil type will work, but less premium |
| C209 | NIP |  |  |  |  |  |
| C210 | 1nF | +/- 5\% | 100V | 8X5 RM5 | MKP, FKP | Any other film or foil type will work, but less premium |
| C211 | 1 nF | +/-5\% | 100 V | 8X5 RM5 | MKP, FKP | Any other film or foil type will work, but less premium |
| C212 | 2 L 2 | +/-5\% | 16 V | 32x16 RM27.5 | MKP | Any other film or foil type will work, but less premium |
| C213 | 2 u 2 | +/-5\% | 16 V | 32x16 RM27.5 | MKP | Any other film or foil type will work, but less premium |
| C214 | 47p | +/-10\% | 16V | 8X5 RM5 | MKP, FKP | Any other film or foil type will work, but less premium |
| C215 | NIP |  | 16V | 8x7 RM5 | MKP, FKP | Any other film or foil type will work, but less premium |

## CuBars, dual pin rows, X7R caps

Double stacked means, just put a second X7R cap on top of each, like a back pack. Ensure at least 1 mm distance between the CuBars and the Caps.
The dual pin rows are standard items with a 2.54 mm spacing, but we need pins only every 5.08 mm . Simply pull out the pins which are not needed.

## Copper piece at output caps

A very low inductive connection of all output caps is necessary to achieve lowest distortion.
The picture shows the folded and soldered copper piece
Note: The amp also works without this. Only needed for lowest distortion.

1. Q309 naked

2. ..now the shield..

The hole in the shield must be 6 mm to ensure that the screw does not touch the copper.
2. a first silicone isolator

4. .. the second silicone pad. The bend corner of the cooper is the solder pad of the shield.

For TO220 it is similar, but instead of a huge hole in the shield - better drill 4 mm and use the screw isolators for TO3. These isolators provide a long enough isloation through the metal of the semiconductor, silicone pad and shield

## The shields must be connected to GND close at the switching stage.

For Q309 and D311 you can directly put a wire from the solder pad of the shield to the GND plane on the PCB.
Just scratch away some varnish from the PCB to create a solder pad on the GND plane of the PCB.
The picture shows such GND connection and also the RC-connection between the heat sink and GND.
The RC is a parallel connection of 1 Meg and a 100 nF ceramic cap connected to the screw of the thermo switch

For D313 you need to drill a small hole in the PCB next to R322.
This allows you to connect a wire through this hole from GND to the shield of D313.
Make sure that the drill hole has at least 1.2 mm distance from all surrounding tracks and pads.

Solder connections of D312 and D313.
The shield does not change these connections and must be isolated from the diode!

Here you can see the diodes with heat sink and shield.
I assembled the diodes first on the heat sink with preformed pins and shield and isolation.
The heat sink back plane has a cut out which allows to connect the diodes as in the picture above
The white wire is the GND wire towards the shield, not connected to the diode itself!

## The attached sketch shows figures for:

Copper shields for Q309, D311 and D313

Aluminium back plane which is the heat sink for D313 and D312.
The back plane shall be electrically connected to the main heat sink with at least four connections.
The drawing does not show the drill holes for the connections, you can comfort this according to your main heat sink.

In order to get it going you will need some patience and follow the described small steps below.
Any short cut bears a high risk to fry your work.

## 1. 12 V operation

The circuit can operate from +/-12V with very minor preparation.
Connect a 1 k 8 resistor parallel to R308
Connect a $3 k 3$ resistor parallel to R324
Now you can power the high power rails (normally $+/-65 \mathrm{~V} . . .+/-83 \mathrm{~V}$ ) from $+/-12 \mathrm{~V}$
Power up the amp from +/-12V and the auxiliary Drv.
a) Both LEDs on?
b) $+/-12 \mathrm{~V}$ still stable?
c) Drv vs -82 V connector correct? Should be 15 V ... 25 V
d) Are +/-1.65V OK? Should be 1.6V..1.75V.
e) Are +/-5V OK? Should be 4.8 V ...5.25V
f) Does the amp operate properly ? Switching frequency should be $310 \mathrm{kHz} . . .360 \mathrm{kHz}$.

## 2. Limited power operation

Remove the 1 k 8 .
Remove the 3k3.
Connect $+/-82 \mathrm{~V}$ through light bulbs. Type $220 \mathrm{~V} / 100 \mathrm{~W}$ or $110 \mathrm{~V} / 60 \mathrm{~W}$.
If you cannot get light bulbs anymore then use two series resistors of 47Ohms / 50W
a) Both LEDs on?
b) Current consumption on $+/-82 \mathrm{~V}$ rails Ok? Should be 75 mA ... 110 mA (my first proto draws 90 mA )
c) Does the amp operate properly ? Switching frequency should be $310 \mathrm{kHz} . . .360 \mathrm{kHz}$.

## 3. Full power operation

Connect also the $+/-82 \mathrm{~V}$ without bulbs or resitors.
a) Both LEDs on?
b) Current consumption on +/-82V rails Ok? Should be 75 mA ... 110 mA (my first proto draws 90 mA )
c) Does the amp operate properly ? Switching frequency should be $310 \mathrm{kHz} . . .360 \mathrm{kHz}$.
d) Test according your taste.
e) Calm down your neighbours.
