

Existing Space:

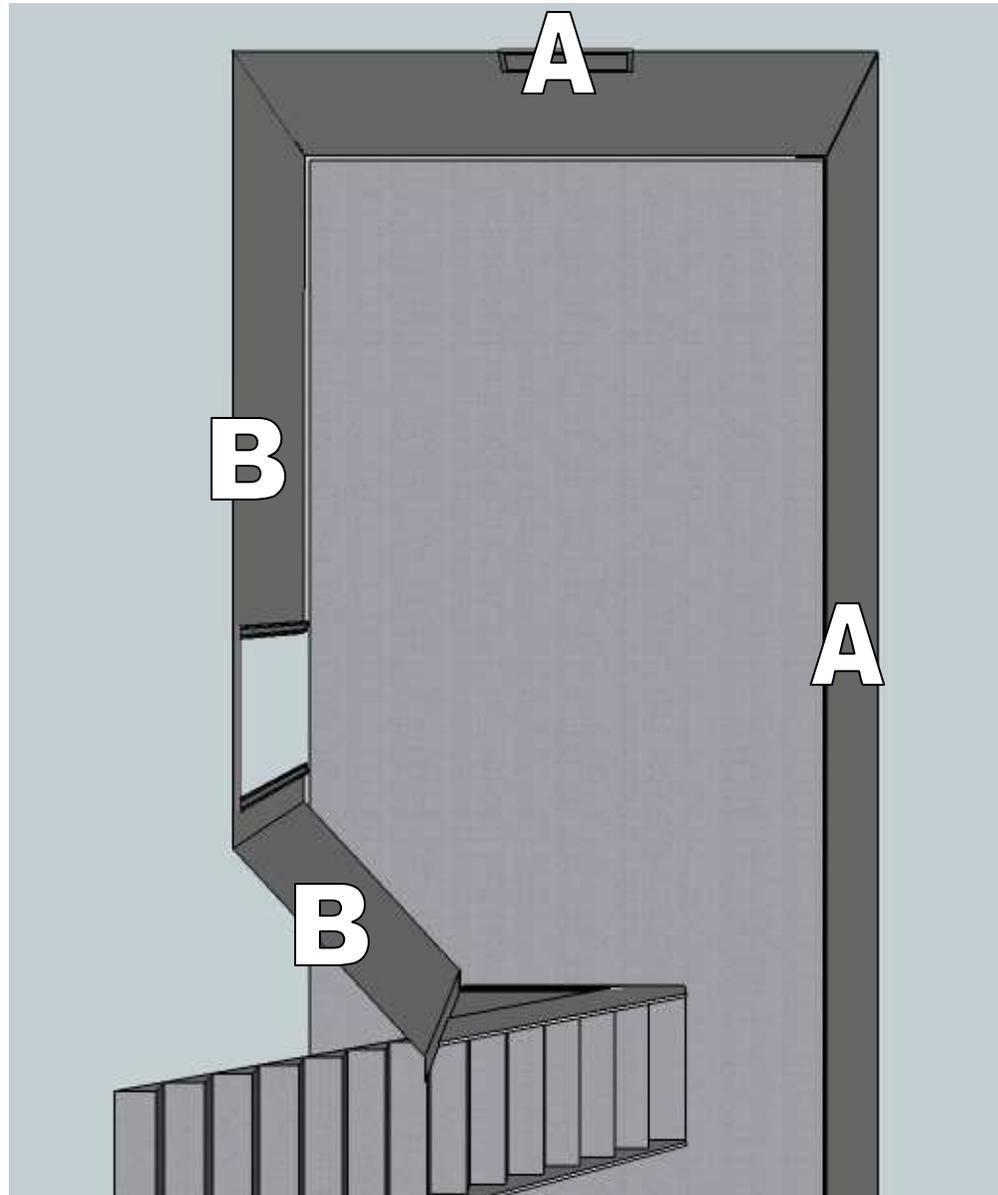

This is the only viable area to locate a TV room in my basement. You'll notice I'm not calling it a Theater or Cinema room. It's barely bigger than a walk-in closet.

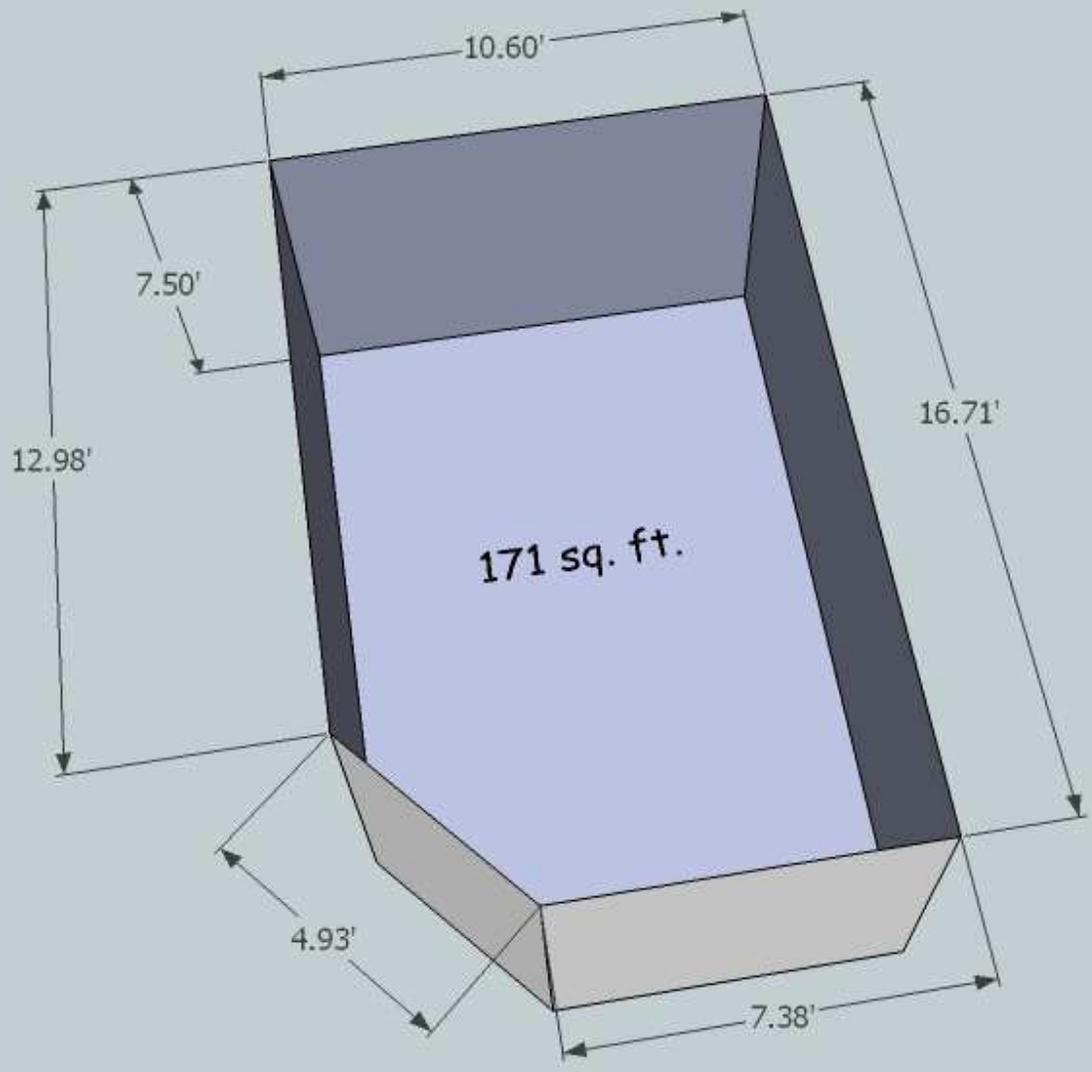

All **walls** are 2x4 framed and covered with drywall. "A" walls are framed against poured concrete walls. I don't know if they have been insulated. "B" walls abut unfinished areas and don't have insulation.

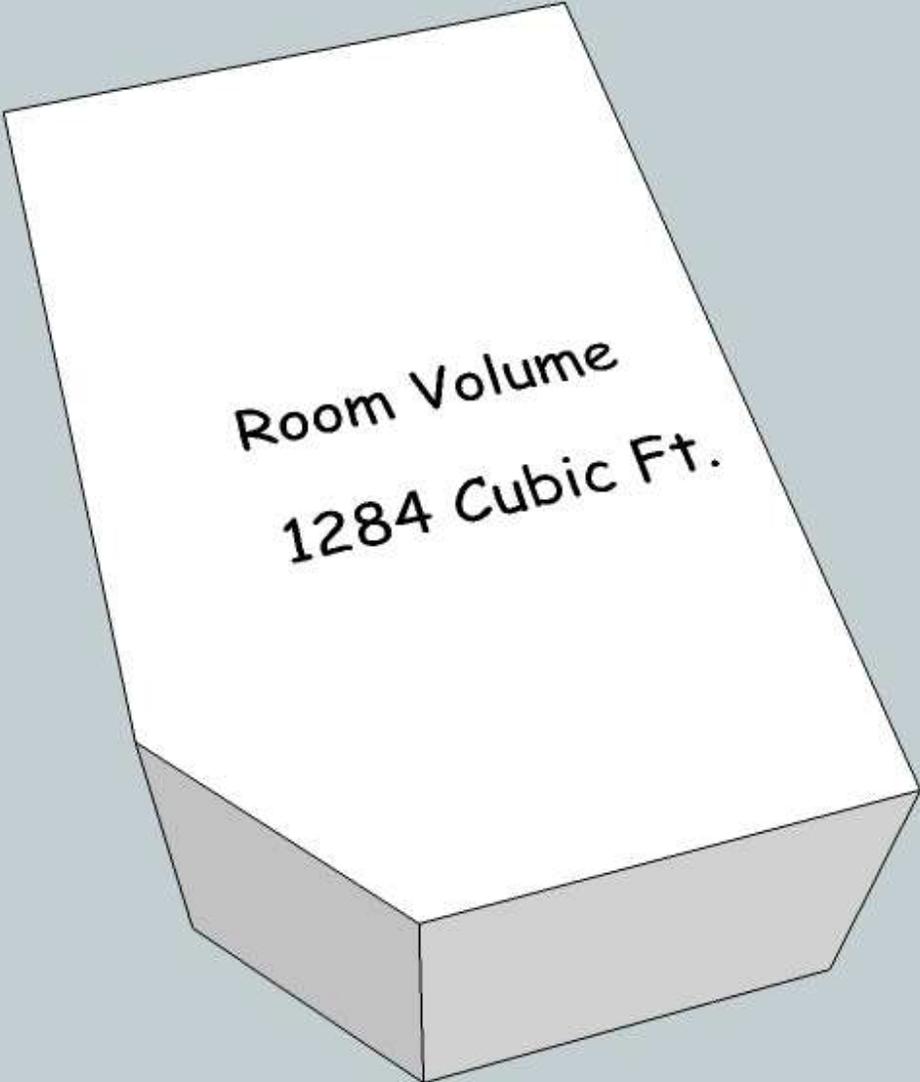

The room has a **drop-ceiling** and the area above is not insulated.

The **floor** is concrete and covered with commercial carpet with very little padding. It's hard.

I'm considering installing a door and wall by the stairs to seal off the room.

Room Volume
1284 Cubic Ft.

This cinema room was designed and built by Brad Horstkotte and the build has been posted on the AVS forum. I'd like to duplicate his GoM wall panels and possibly the speaker columns too.
