

The Roland acoustic guitar amp on the left is rated at 15 watts per channel, sounds really great.  
How do I get this beast inside my guitar?

Easy, use a big saw!

The amp of course is a printed circuit board with speaker wires and controls.

I don't need the speakers, and my guitar is the housing.

The speakers in the amp are rated at 4 ohms and so are mine.

As noted, the amp speakers are rated at 15 watts each, mine are 20 watts each, no trouble.

I still need to relocate one of the small boards, and it will fit, with battery pack.
