

(Note. Component's removed at this stage. c2426, 2409 and 2109 (220nf))

This Test.

1. Replaced 3403 and 3406 components.
2. We are using 2426 and 2109 on the flying leads.
3. 2109 (220nf) fitted on a pair of flying leads connected to **A** and **E**.
c2426 is fitted on a pair of flying leads connected to **A** and **C** in reverse giving a +.
4. Soldered a flying lead from c402 **D** to 2426 **A** with an additional capacitor fitted same size in line (keeping the polarity the same way as fitted to the board) for this quick test.

Test results; had to turn up the volume (more this time) to activate music/red neon. The sound coming from the bass speaker was lower than the previous test.
