Specific Complaint**PROCEDURE**

PROBLEM: FM display works but there is no signal strength indication or sound.

This problem has been traced to leaky or shorted disk ceramic caps at the input of IC 001. To verify this possibility check the voltage at pins 1, 2 & 3 of IC 001. The voltage at these three pins must be identical, (approximately 2.6 volts). If there is any wide variance (.2 volts or greater) change capacitors C006, C007 and C008. This will restore balance to the differential input stage of IC 001 and allow proper operation.

PROCEDURE

- PROBLEM: 1 High pitch squeal with no input and volume control at 10:00 position
- 2 Intermittent AM/FM display
- 3 One channel cuts out on AM or FM

Most of the above symptoms can be corrected by applying contact cleaner to the 5 molex connectors on the back side of the AM/FM display circuit board. These connectors are accessible by removing the top cover of the receiver.

Specific Complaint

PROCEDURE

PROBLEM: Loud "pop" thru the speakers when the unit is turned off.

To correct this problem install a .01 uF ceramic capacitor of 500V capacity or greater across the switched and unswitched AC outlets of the receiver. The AC outlets are accessible by removing the bottom panel of the receiver.

NOTE: Be sure that the leads of the capacitors are trimmed close to ensure that there is no possibility of their making contact with the chassis bottom cover.
