

This is the LM3886 and “I think” mute system. Any idea, how I can “tap” into the “1”, “9”, “5 & 6” pins to separate from the zones in this amp? I get that Pin 1 & 9 are the positive input from the RCA.

Question – what do I do with the 5 & 6 pins?

Additionally – do I have to ground all the other pins, or is that only there because they go to the 6-zone board?

This is the connector from the LM3886 above (JP3) and it's associated connector on the 6-zone board.
