

Brown, differential base to emitter current  
 Green, differential collector to emitter current

Orange is bootstrap app current, and bias current, and VAS collector to emitter current

Thin green line, VAS base to emitter current

Violet is rail currents feeding differential, and Bootstrap app, and VBE multiplier, and VAS output current, and driver base to emitter and output base to emitter

Light blue is driver collector to emitter current...depends on bias adjustment and 2mV depends on the R19 value

Grey-blue is the output collector to emitter current.
