

CYRUS

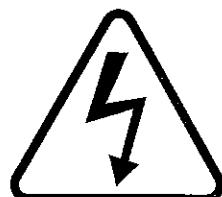

SERVICE MANUAL

SPECIFICATIONS

Audio output	2V rms.
Frequency response	20Hz-20kHz
THD	<0.008% (ref. 1kHz, -10dB)
S/N ratio	100dBA
Dynamic Range	>100 dB (20 Hz to 20 kHz)
Channel separation	>100dB (1kHz), >95dB (20kHz)
Clock Jitter	<100pS
Power Consumption	16W (12W Standby)
Weight	3.5 Kg
Dimensions (H x W x D)	78 x 215 x 360 (mm), 3.1 x 8.4 x14.1 (inches)
Finish	Black

CYRUS dAD3 SERVICE CAUTIONS

These two symbols shown are displayed prominently on the Cyrus dAD3 base cover label. They indicate that the following cautions must be observed by all personnel-

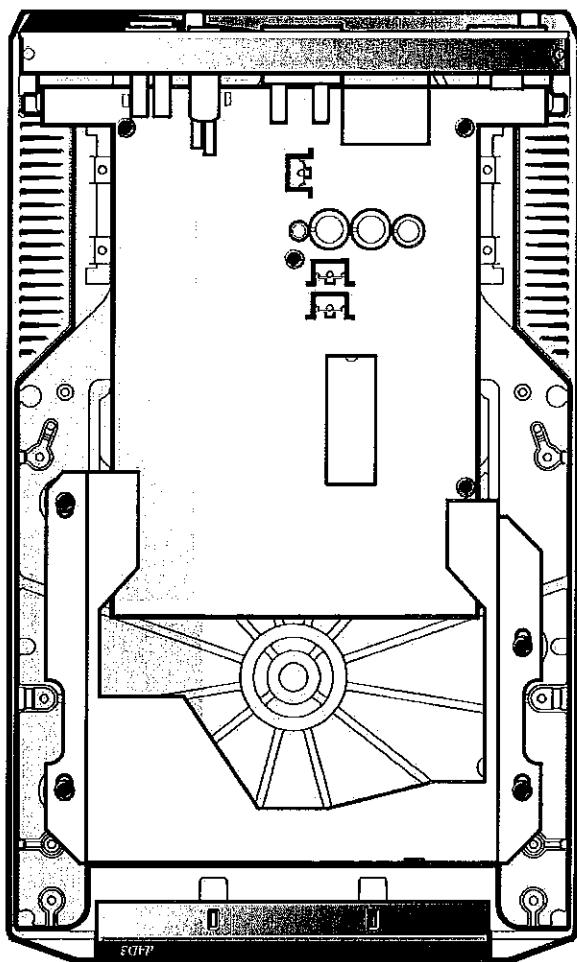

CAUTION: TO REDUCE THE RISK OF ELECTRICAL SHOCK, DO NOT REMOVE COVER OR BACK.

THERE ARE NO USER SERVICEABLE PARTS INSIDE THE PRODUCT.

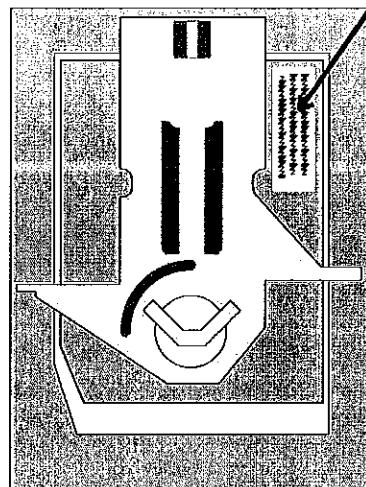

ALWAYS REFER SERVICING TO QUALIFIED SERVICE PERSONNEL.

CYRUS dAD3 SERVICE CAUTIONS

The notice below shows the position of caution labels which alert the service technician to the presence of a laser device –

DANGER: INVISIBLE LASER
RADIATION WHEN OPEN.
AVOID DIRECT EXPOSURE
TO BEAM.

CD MECHANISM
REMOVED FROM CHASSIS
AND INVERTED

CYRUS dAD3 SMD COMPONENT REPLACEMENT

Handling

SMD resistors and capacitors are widely used in the Cyrus range of products. When handling SMD components, certain precautions should be observed-

Handling SMD resistors and capacitors

- Always store SMD components in their original packaging or in a cool dry environment.
- Always handle SMD resistors and capacitors with tweezers or a vacuum pencil.
- Never handle SMD resistors and capacitors with fingers.
- Hold the SMD component by the body, not by the ends.
- Do not use SMD resistors or capacitors if the ends are dirty or discoloured.
- Do not use SMD resistors or capacitors if they have been dropped on the floor- they may be internally damaged.
- Always use replacement components of the correct size and shape. SMD components are available in many different packages. Where possible, order original parts from Cyrus.

Handling SMD ICs

- Always store these components in their original packaging or in a cool dry environment.
- Always handle SMD transistors and ICs with tweezers or a vacuum pencil.
- Never handle SMD transistors and ICs with fingers.
- Ensure that the connection pins of larger multi-pin ICs are not deformed or damaged before fitting.

Measuring circuits with SMD capacitors and resistors

- Avoid using sharp, pointed probes directly on the component end caps.
- Measure voltages from the PCB pad next to the component.

Static precautions

SMD components, particularly ICs, may be damaged by the static levels present in the workshop. Damage caused by static may not immediately cause component failure but could cause partial damage and a possible failure in the future. Observing these simple SMD precautions will avoid product failures related to static damage-

- Always wear a grounded wristband when replacing *any* electronic components.
- Always store components in their original packaging or conductive plastic bags.
- Never store components in plastic trays or bags without protection.

Soldering/desoldering SMD components

- Never re-use old SMD components after de-soldering!
- Always apply solder heat directly to the contact area. Avoid over-heating adjacent components.
- Always repair SMD PCBs with the correct tools. SMD components can only be replaced with a hot air pencil or soldering iron designed for SMD components, preferably with temperature control.
- Keep the soldering temperature as low as possible. 260°C is recommended for SMD rework. Most SMD components will withstand 260°C for 5 to 10 seconds
- Use tin/lead/silver solder which has a lower melting point (about 179°C). Tin/lead/silver solder paste or small gauge solder (26SWG) is recommended.
- When using solder paste a pressure dispenser should be used to ensure the correct amount of solder is applied to each pad.

CYRUS dAD3 SMD COMPONENT REPLACEMENT

- Solder paste should not be used with direct heating methods as the solder between component pins may not be melted.
- If necessary, remove excess solder paste with solder braid.

Removing SMD resistors and capacitors from the PCB with a soldering iron

1. Fit the soldering iron with a tip large enough to bridge both ends of the component.
2. Place the soldering iron so that its flat tip will heat both ends of the component at once.
3. When the solder melts, remove the component with tweezers.
4. Allow the PCB to cool for a few minutes, removing any excess solder with desoldering braid.

Fitting replacement SMD resistors and capacitors to the PCB with a soldering iron

1. Apply a little flux to the connections.
2. Place the component in position.
3. Tin the soldering iron, bring the tip into contact with the PCB pad and flow solder to the joint. Avoid bringing the soldering iron tip directly into contact with the component.

Removing SMD ICs from the PCB

1. Using fine tipped side cutters or tweezer cutters, snip all the leads of the device and remove the IC body.
2. Desolder the leads from the PCB pads.
3. Clean up the PCB with solder braid.

Removing SMD ICs with a hot air SMD tool

1. Fit a suitable size tip for the IC being removed.
2. Heat the IC evenly until the solder melts.
3. Remove the IC with tweezers.

Fitting replacement ICs to the PCB with a soldering iron

1. Check that the pins of the IC are not distorted.
2. Using tweezers, position the IC over the footprint.
3. Check that all the IC pins are correctly aligned with the pads.
4. With a very fine tip soldering iron, solder in the pins at the corners of the IC.
5. Re-check the alignment and correct if necessary.
6. When the alignment is OK, solder the remaining pins of the IC to the PCB.

CYRUS dAD3 TYPE IDENTIFICATION

Rating label

The Cyrus dAD3 is manufactured to meet the power requirements of different world markets. Each dAD3 carries a rating label on the rear panel which includes details of the following:

Nominal power voltage

This will be either 230V For use on nominal 220V - 240V AC mains supply.
 115V For use on nominal 110V - 120V AC mains supply

If it becomes necessary to adjust the nominal voltage for use in another zone, the power transformer and the power fuse must *both* be replaced with original parts from Cyrus to be the correct type for the new zone

AC fuse rating

The AC fuse rating is also shown on the label. If replacing the AC fuse it is essential that the replacement fuse is exactly the same specification as the original fuse, supplied by Cyrus. All mains fuses have a 'Timelag' blow characteristic.

Power consumption

The power consumption figure is indicated under normal operating conditions.

Serial number

Each Cyrus dAD3 carries a serial number code which identifies the following-

- Type of product
- Market destination
- Build number

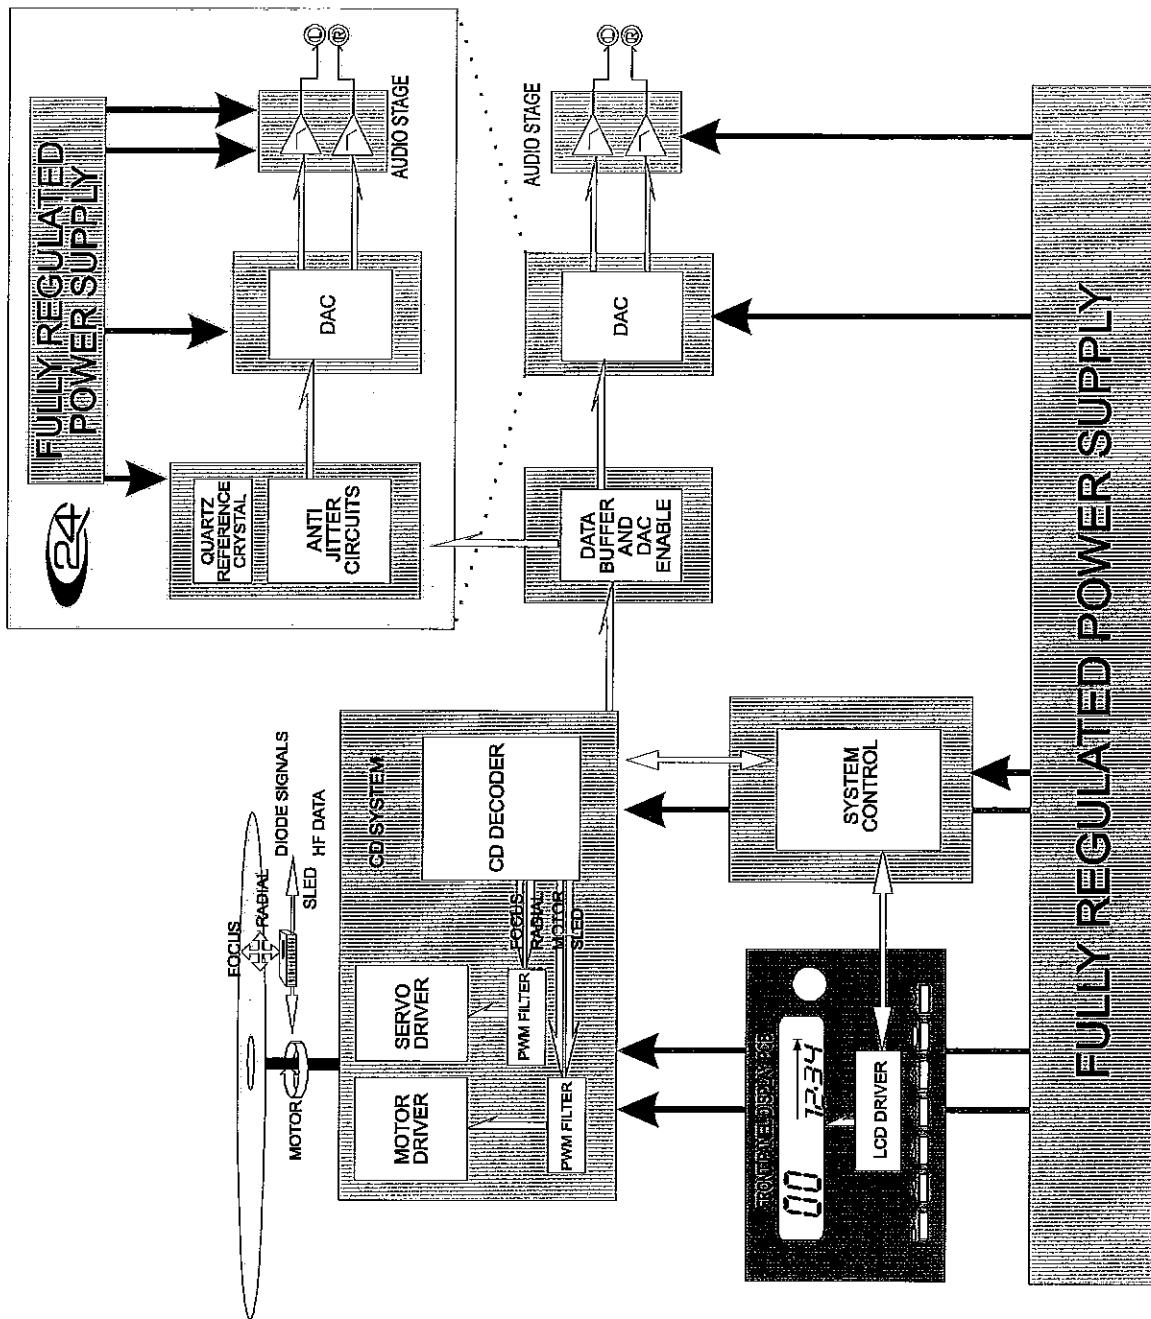

The serial number is visible through a window in the base plate caution label. It is therefore important to ensure that a base plate removed from a product is re-fitted to the same product. In any communications with Cyrus Service or Quality departments it is essential that the full serial number is quoted so that original specification parts and service information may be supplied.

PCB Identification

In the course of manufacture the PCB artwork of the dAD 3 has changed slightly, all change details are listed in right hand column of the PCB parts list. Each PCB is marked with a design revision number and this number should be quoted in all correspondence to the service department when requesting technical advice or requesting spare parts. The table below shows the markings, which are found on each main PCB.

Revision number	PCB marking
Main board revision 1	HA7Q1361
Main board revision 2	HA7Q1362
Main board revision 3	HA7Q1373

CYRUS dAD3 BLOCK DIAGRAM

CYRUS dAD3 TECHNICAL DESCRIPTION

Power Supply

The unit is powered from a single power transformer, providing both high voltage, +/-18Vdc, and low voltage, +/-8Vdc, output for regulation.

Each area of the circuit then has its own regulated supply. In addition, the 9V supply (VR200 and VR201) for the servo drivers has a power on delay. The 5V supply for the DAC is switched by the control microprocessor (IC400) via T701 and T702. The power supply is switched off in Standby or when a plug-in DAC module is fitted.

The addition of a PSX-R will supply the high voltage requirements of the CD player, ie the analogue amplifier and servo drivers. The PSX-R is operated in 21V mode, and is switched in and out of standby by DOEN which is connected to AMPIN. The 21V is present all the time that the PSX-R and Cyrus dAD3 are switched on, regardless of standby mode, and is switched to 21V mode by TR700 taking PSXO low.

Test point	Play voltage	Standby voltage	Regulator	Function
C221 +ve	+9V	+9V	VR200	Servo driver supply
C220 +ve	+9V	+9V	VR201	Motor driver supply
C217 +ve	+5V	+5V	VR202	Servo processor/CD decoder supply
R505	+5V	+5V	VR400	Tray motor supply
T504 emitter	+5V	+5V	VR401	Backlight supply
IC302 pin 14	+5V	+5V	VR402	Data buffer supply
T702 collector	+5V	0V	VR700	DAC supply
IC602 pin 4	+10V	+10V	VR701	Analogue filter supply
IC602 pin 8	+10V	+10V	VR702	Analogue filter supply

Control microprocessor

The control system is set up with two microprocessors, the control microprocessor IC400 which reads the keys, remote control and MC-Bus and drives the display and the CD command microprocessor IC200 which controls all functions of the CD module. Communications between the main microprocessor and the command microprocessor is via a data bus from pins 22, 23, 24 of IC400 to pins 5, 7, 13 of IC200.

CD Servo

The CD servo circuit consists of a servo microprocessor IC100, which interfaces to the CD decoder IC300. This microprocessor, executes the code necessary to obtain disc focus, disc motor spin and tracking position.

The radial, focus, disc motor and sledge servos are driven by two dual driver IC's (Philips TDA7073), which are controlled by the servo driver. All clocks for the system are generated by the decoder IC, which also provides the digital audio output signal. PHASE is a line generated by the microprocessor in response to commands from the front panel or remote control. A high on this line will invert the data to the DAC, low is normal operation.

CYRUS dAD3 TECHNICAL DESCRIPTION

DAC/audio output stage

The digital audio signals are output from the CD decoder IC300. The digital to analogue converter IC601 is a bit stream continuous calibration filter DAC. The output is clamped during periods of no audio output, or invalid audio.

The MUTE line is generated by the CD decoder IC and is active low, it is low for all instances, except when valid audio is detected by the decoder. This is then inverted by T601 to produce a level to turn T602 and T603 on, thus clamping the output to ground.

All signals to the DAC are also taken to a set of connectors for an upgrade module. This is to allow for the addition of an upgrade DAC module in the future. The addition of another DAC module will disable the main board DAC IC601 by turning off the supply to it, and isolating it from the signals going to it. The audio is connected to the output via left and right jumper selectors, and a jumper is fitted to the appropriate header to select between the internal DAC or the upgrade module.

CYRUS dAD3 USE WITH PSX-R

Multiway connector pin assignments

The connections between the Cyrus dAD3 and PSX-R function as follows-

Pin 1 (Standby)

This is an output from the Cyrus dAD3 to send a standby control message (logic 1, +5V) to the PSX-R, enabling the regulated power supplies of the PSX-R. Note that this pin will not change state if the Cyrus dAD3 detects a fault (See pin 5).

Pin 2 (Positive supply)

For the Cyrus dAD3 application this pin delivers +21V from the PSX-R to the Cyrus dAD3 servo control motors for CD mechanism. This is switched by the Standby control system.

Pin 3 (GND)

This pin is the system ground return between the Cyrus dAD3 and PSX-R.

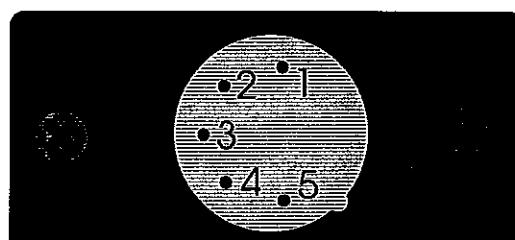

Pin 4 (Negative supply)

For the Cyrus dAD3 application the -21V delivered from the PSX-R is not used by the dAD3. This is switched by the Standby control system and loaded (R722, see circuit diagram) to achieve zero current follow in the GND return.

Pin 5 (PSX-R detect)

This pin is an input to the Cyrus dAD3 to detect the presence of a working PSX-R. The line condition is Logic 0 (0V) at all times when a PSX-R is connected and power is applied.

This diagram shows the pin numbers of the Cyrus dAD3 power supply input connector. View is of the connector pins from the rear of the CD player.

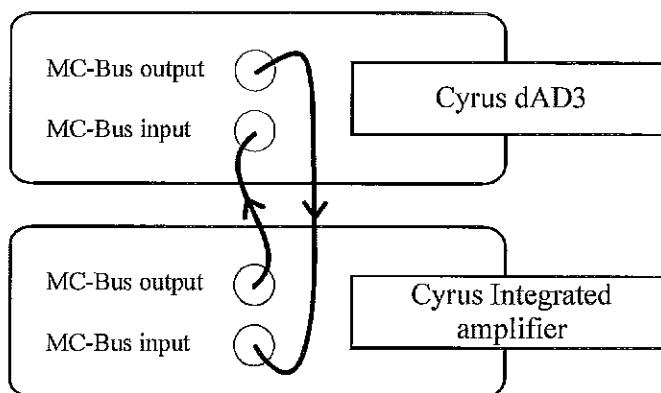

CYRUS dAD3 MC BUS OPERATION

The MC-Bus system

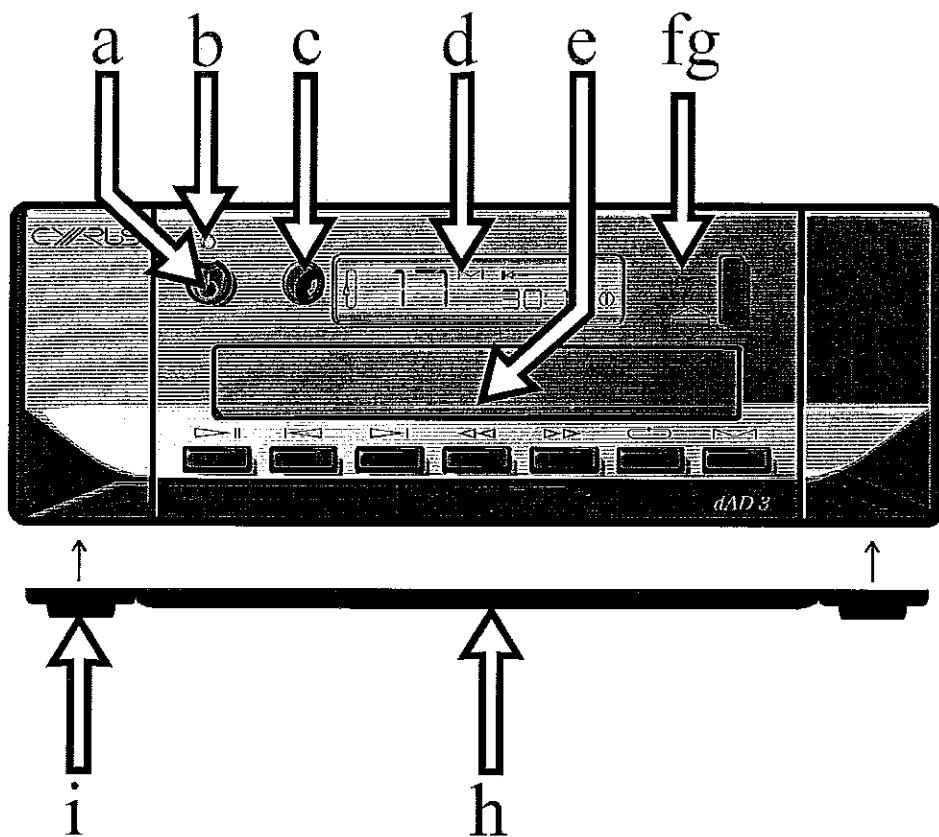

MC-Bus is a system which provides communication between the control systems of a number of Cyrus products. The communication takes the form of a serial data stream which is sent from a 'master' product and received and repeated by 'slave' products. The data is thus passed from one product to another around a loop. The master product should then receive the message back which confirms that loop connections have been correctly made. The CD player is a 'slave' product and listens for 'CD' commands from the master product in the loop (usually an amplifier or surround decoder).

MC-Bus system tests

The MC-Bus system can be tested by connecting the dAD3 into a known working Cyrus system. Note that MC-Bus must be connected as a closed loop as shown in the diagram below. It is also important to connect the audio signal cables between components to provide an adequate ground return path for the MC-Bus signals. Switch on the power to the system and set all components to Standby. Selecting the CD input on the amplifier will bring the dAD3 out of standby. When the amplifier is set to Standby, all other components connected to the MC-Bus loop will also set to Standby.

Key:

CP = ceramic plate. EL = electrolytic. PE = polyester. PP = polypropylene. BP = bi-polar.

CAPSMD4.0 refers to surface mount device with 4.0mm pitch pads

SMD-0805 refers to surface mount device size code 0805
