TECHNICAL INFORMATION

CYRUS

MODEL NAME:

CYRUS PRE

FACTORY PRODUCTION CODE:

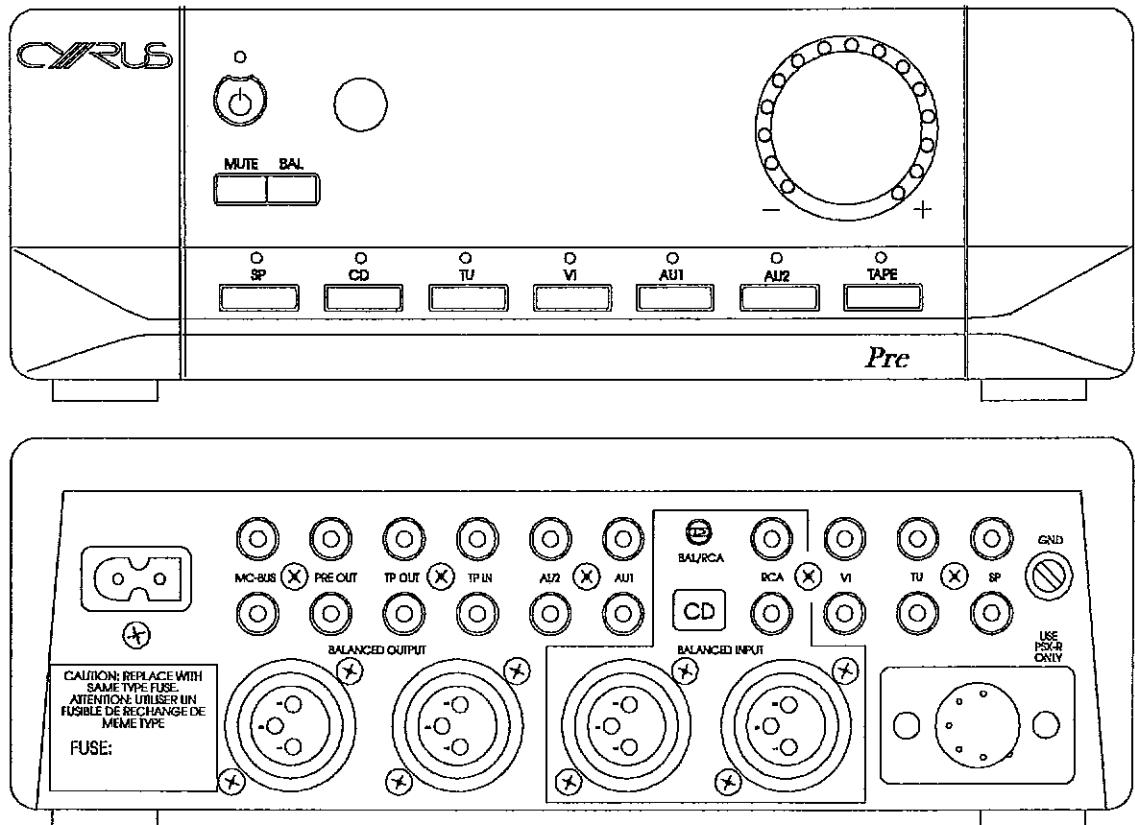

CYRUS HA7L

1. Overview.

The HA7L is a very high quality state of the art micro processor controlled stereo pre-amplifier, fitting into a standard Cyrus casting. The signal path is kept as short as possible to maintain sonic purity, while not compromising performance or features. This is achieved by using relays for input selection and tape monitor, a motorised potentiometer for the volume and balance control, a single current feedback amplifier per channel for the output buffer (the feedback path is shorter in a current feedback amplifier with respect to its equivalent conventional amplifier).

To reduce ground noise and power supply noise in the analogue circuits the HA7L is internally powered from a small internal transformer or upgradable for Cyrus PSX-R connection then with internal remote constant current sources (ccs) used in conjunction with local active zener regulators the 27V (PSX-R used in variable mode) is regulated to 15V.

The digital circuits are powered from a small internal 5V transformer regulator circuit.

Facilities include:

- Input selection where the CD input can be either 600ohm balanced or standard RCA (switchable via a small rear panel toggle switch).
- Tape monitor function.
- Volume control, 0 to -62dB then mute.
- Fading mute/unmute control.
- Balance control.
- Pseudo balanced output (balanced impedance) as well as singled ended output.
- Optional plug-in MM or MC phono module (without the upgrade module the input is a standard RCA).
- Standby control.
- Full remote control (RC5).
- PSX-R Upgradable.
- MC-bus interface.

3. Functional Blocks.

3.1. Optional upgrade input.

The MM and MC pre-amplifier up grade module plugs into the upgrade socket on the mother board to convert the SP (SPecial) input to either MM or MC from a standard line level RCA input. Both the MM and MC modules use parallel pairs of input transistors for lower noise. The MM module uses two NE5534's per channel. The first NE5534's has its internal input stage biased off and substituted with an external low noise parallel differential pair (2SD786's), this configuration does not increase the signal path length, but improves the noise performance. The 75uS time constant is a passive pole after the first op-amp, the second op-amp finishes the E.Q. and amplification.

Shunt regulators are on the plug-in module providing 2x +/-15V.

The SP input comes with a blanking board as standard to provide an extra RCA line input.

3.2. Input selection and Tape Monitor.

In order to maintain a short signal path (in both silicon and PCB tracks) the input and tape monitor selection is via relays. The input selection relays form the equivalent to a 2P6W switch, switching 'one hot' between one of the six analogue inputs this is then followed by the tape monitor relay. The CD input can be configured either as balanced or RCA input, this is controlled by a small toggle switch on the rear of the unit. The record out signal is unity buffered to ensure the tape recorders input impedance does not impair the listened to audio signal.

3.3. Volume Control.

To reduce the silicon/PCB signal path the volume control uses two (one per channel) motorised potentiometers (motpot) each having two ganged wafers (one linear and one log law) rather than a solid state gain cell. The micro processor controls the volume by sending a nine bit word to an R-2R ladder, the ladder's output voltage becomes the reference voltage for a DC servo who's output is connected to the motpot's motor the servo's feedback is from the motpot's second track (linear law) biased as a DC potential divider therefore the motor turns until the voltage from the linear track equals that of the reference voltage. The analogue signal is attenuated by the motpot's other ganged track (log law). During test on production the motpot's 2^9 (512) steps are calibrated to give 63 discrete 1dB steps (0dB to -62dB) to give the volume the same feel as the Cyrus III. The volume level can be adjusted either by the front panel shaft encoder, remote control or MC-Bus (for test purposes only).

3.4. Output Buffers.

The Output Buffers use current feed-back amplifiers as building blocks, with an overall voltage gain of 5.6dB to give a 381mV output for an input of 200mV, this exactly matches the Cyrus III's pre-amp gain to ensure compatibility through out the range.

3.5. Output Network.

The output network performs three functions, they are single ended output, balanced output and output mute. The balanced output is a pseudo balanced output i.e. a balanced impedance output, this will give the same external noise rejection as a true balanced output and is lower noise, distortion and lower component count.

3.6. Constant Current Sources.

The DC power for the analogue stages is distributed around the pre-amplifier by a constant currents rather than constant voltages. The output impedance of constant current sources are very high therefore the radiated and induced field from the power lines are very small. The final voltage regulation is done locally at the active blocks with shunt regulators. This method of regulation virtually eliminates stages interacting with each other via the power supplies and gives very low noise local DC rails.

The constant current sources are powered from either the internal transformer or the PSX-R, set to 27V in variable mode.

3.7. Digital 5V Regulator.

The digital circuits are power from a separate winding on the internal transformer power supply and 5V chip regulators.

3.8. The Micro Processor.

The micro processor controls all the pre-amp functions (except the CD XLR/RCA selection) and uses an NV RAM for the volume control look-up table.

4. Basic Functions.

See overview above.

5. Input and Outputs.

5.1. Inputs.

- SP Special set to analogue signal at line level, via phono sockets on the rear; being up grade-able to MM input or MC input.
- CD RCA analogue signal at line level, via phono sockets on the rear.
- CD XLR Balanced stereo analogue signal at line level, via XLR sockets on the rear.
- TU Tuner analogue signal at line level, via phono sockets on the rear.
- VI Video analogue signal at line level, via phono sockets on the rear.
- AU1 AUX1 analogue signal at line level, via phono sockets on the rear.
- AU2 AUX2 analogue signal at line level, via phono sockets on the rear.

- TP Tape analogue signal at line level, via phono sockets on the rear.
- PSX-R +/-27VDC via the PSX-R socket on the rear.
- Mains via an figure of eight mains socket on the rear, being internally fused.
- Infra red remote signal via an eye on the front panel.
- MC-BUS via a phono socket on the rear.

5.2. Outputs.

- Stereo single ended analogue signal, via phono sockets on the rear.
- Stereo pseudo balanced analogue signal, via XLR sockets on the rear.
- TP Tape record out, stereo analogue signal at line level, via phono sockets on the rear.
- MC-BUS via phono socket on the rear.

6. Connections.

6.1. Front.

None.

6.2. Rear.

As described in 5.2 and 5.1

7. Panel Controls

7.1. Front.

- Soft power (Standby).
- Fading mute.
- Balance mode button.
- SP selector.
- CD selector.
- TU selector.
- VI selector.
- AU1 selector.
- AU2 selector.
- TP selector.
- Volume/Balance control.

7.2. Rear.

- CD RCA/CD XLR toggle switch.

8. Remote Control.

The Pre-amp is fully control-able via an IR remote control.

9. Displays.

See user interactions.

10. User Interactions.

As per the Cyrus III except for:

- The CD input can be either RCA or XLR.
- An extra AU input has been added.

11. Error Test Conditions.

Power up

On power up the micro will reset its self sweeping all the LEDs as per the Cyrus III.

Disconnected Mains

If the mains is disconnected no LED will light

Faulty PSX-R/analogue power supply

The power LED will flash black/red, see PSX-R operation.

12. Performance/Technical Targets.

Power Input

230VAC/115VAC 5W and PSX-R

Measured Performance.

Sensitivity for rated output.

Line inputs	200mV
Bal input	77.5mV
MM (op)	2.75mV
MC (op)	150uV

Output Level (Volume at maximum)

RCA	381mV
XLR	147mV into 600 ohms

Frequency Response

Line	1Hz to 100KHz
------	---------------

THD 20Hz to 20KHz (inc hum)

Line	0.005%
------	--------

Output slew rate

Line	200V/uS
------	---------

Signal to noise (inc hum where applicable)

Line/bal (500mV I/P)	110dB (AWTD)
Line/bal (500mV I/P)	108dB (UNWTD)
MM (SP) (5mV I/P)	84dB (AWTD)
MC (SP) (0.5mV I/P)	70dB (AWTD)

Volume levels

12.1. discrete 1dB steps including mute.

5431
 VOLTAGE D/P-SEND
 PLACE AT VOL CONTROL
 ALL TRANSISTORS ARE S

The diagram illustrates a 16-bit digital-to-analog converter (DAC) circuit. It features a 12-bit R-2R ladder network at the bottom, followed by a 4-bit DAC section. The 12-bit R-2R ladder has resistors labeled R1 through R12. The 4-bit DAC section includes resistors R13 through R16 and a switch labeled S1. The circuit also includes a reference voltage source labeled VREF, a current source labeled IREF, and various operational amplifiers (OPA1, OPA2, OPA3, OPA4) and logic components (NAND, NOR, NOT) for signal processing and control.

The diagram illustrates the internal structure of the 4341 integrated circuit, which contains two operational amplifiers (OPA) and two photodiode driver stages (OPHOT). The circuit is divided into two main sections by a central vertical bus.

Left Side (Non-Inverting Inputs):

- OPA 1:** Non-inverting input is connected to ground through R468. The inverting input is connected to the output of OPA 2 through R462 and R422. The output of OPA 1 is connected to the non-inverting input of OPA 2 through R458.
- OPA 2:** Non-inverting input is connected to ground through R454. The inverting input is connected to the output of OPA 1 through R422 and R462. The output of OPA 2 is connected to the non-inverting input of OPHOT_L through R481.
- OPHOT_L:** Non-inverting input is connected to ground through R481. The inverting input is connected to the output of OPA 2 through R422 and R462. The output is labeled OPHOT_L.
- OPHOT_R:** Non-inverting input is connected to ground through R482. The inverting input is connected to the output of OPA 1 through R458. The output is labeled OPHOT_R.

Right Side (Inverting Inputs):

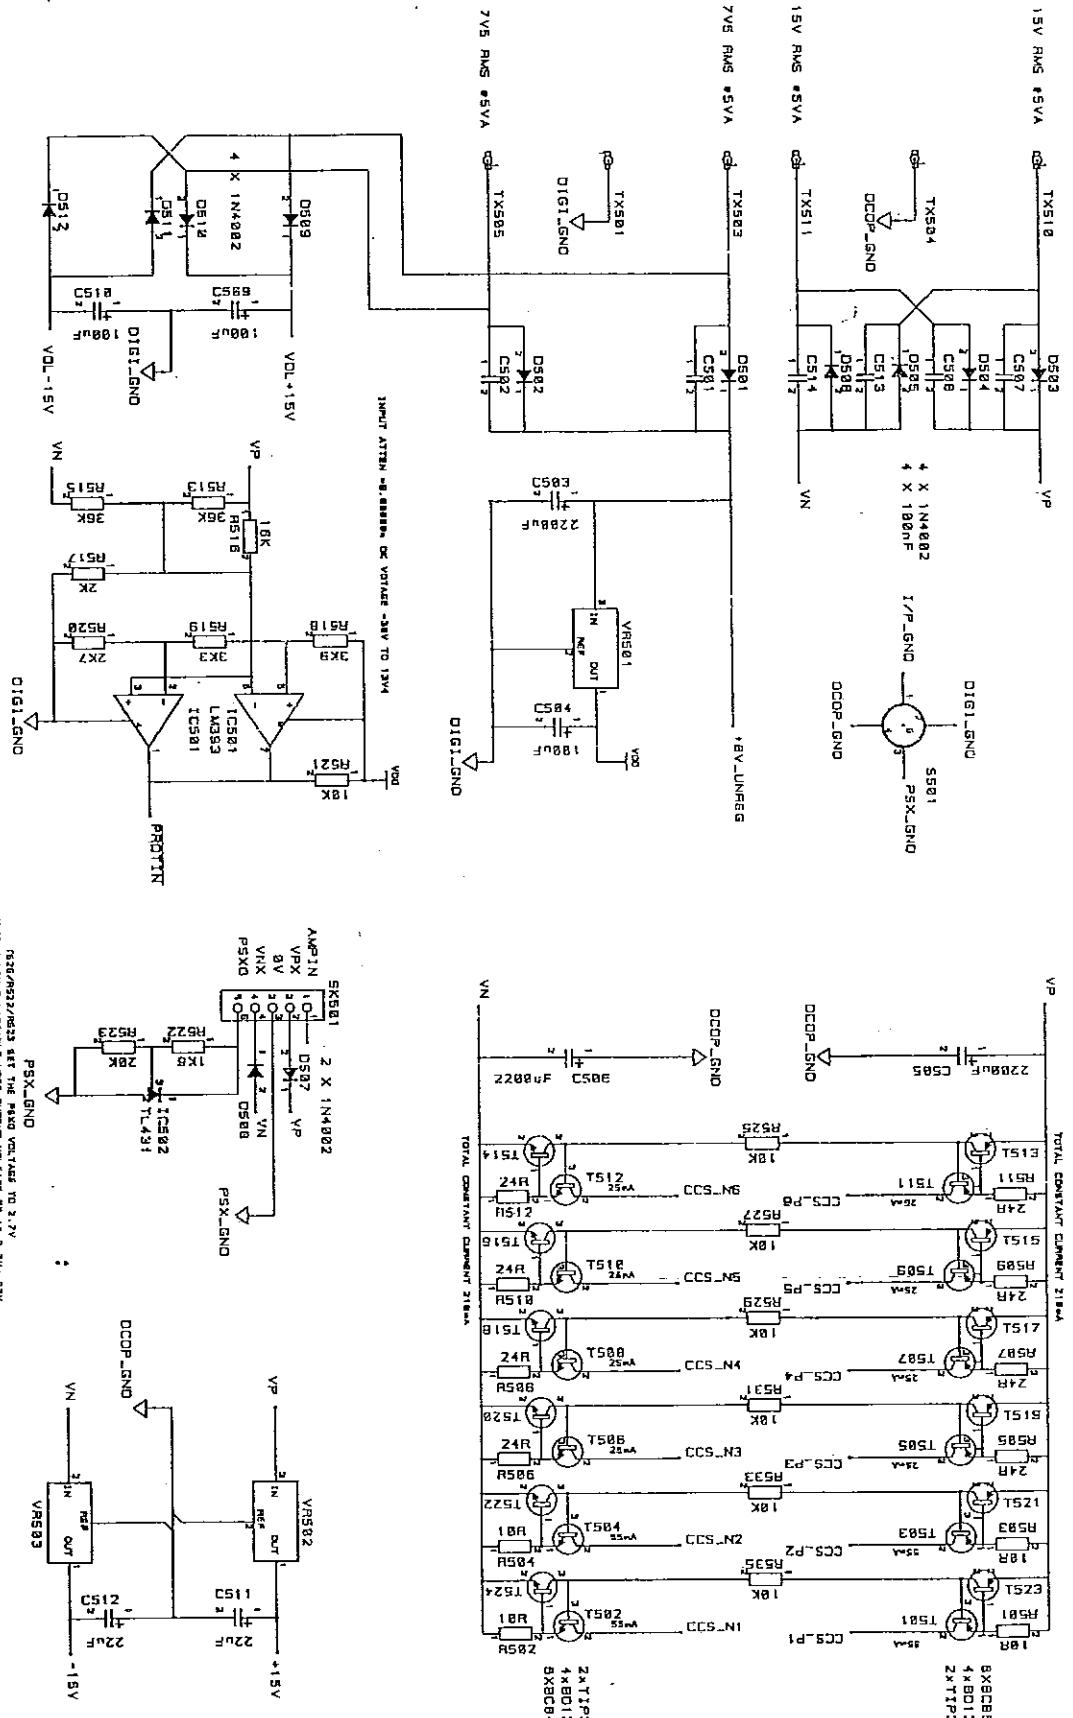

- OPA 1:** Non-inverting input is connected to ground through R454. The inverting input is connected to the output of OPA 2 through R422 and R462. The output of OPA 1 is connected to the non-inverting input of OPA 2 through R458.
- OPA 2:** Non-inverting input is connected to ground through R458. The inverting input is connected to the output of OPHOT_L through R481. The output of OPA 2 is connected to the non-inverting input of OPHOT_R through R482.
- OPHOT_L:** Non-inverting input is connected to ground through R481. The inverting input is connected to the output of OPA 1 through R458. The output is labeled OPHOT_L.
- OPHOT_R:** Non-inverting input is connected to ground through R482. The inverting input is connected to the output of OPA 2 through R422 and R462. The output is labeled OPHOT_R.

Power Supply and Grounding:

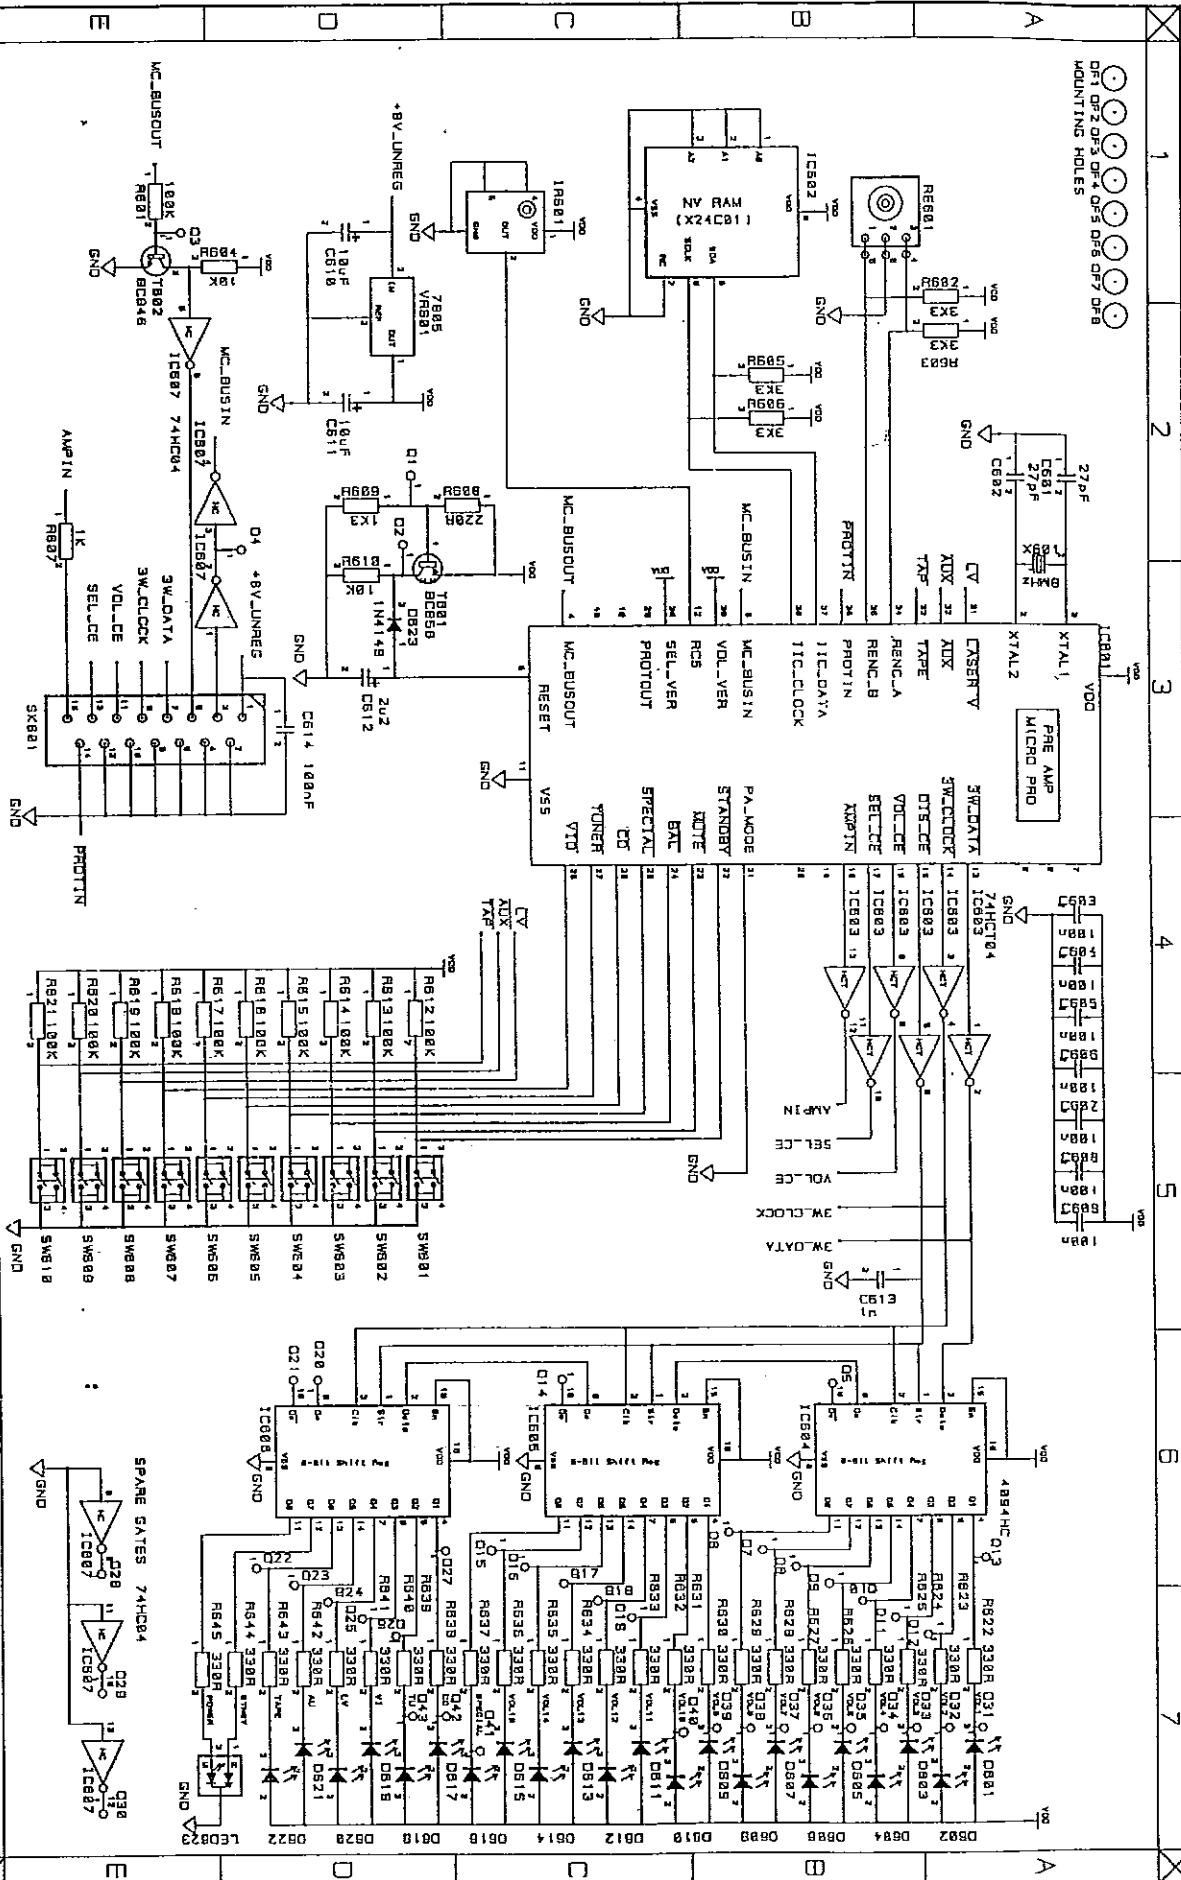

- V_{CC} is connected to the non-inverting inputs of both OPAs and the non-inverting inputs of both OPHOT stages.
- V_{EE} is connected to the inverting inputs of both OPAs and the inverting inputs of both OPHOT stages.
- NON-SMD ground is connected to the ground terminals of the IC package.
- DC bias voltages V_{B1}, V_{B2}, V_{B3}, and V_{B4} are applied to the base terminals of transistors Q424, Q426, Q454, and Q458 respectively.

Pinout Summary:

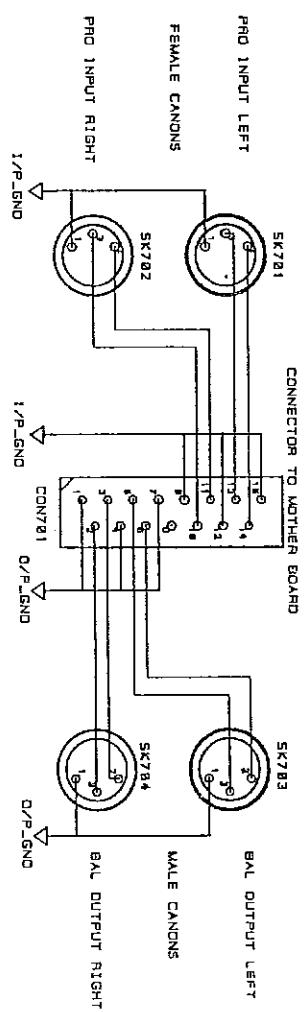

- Pin 1: V_{CC}
- Pin 2: V_{EE}
- Pin 3: GND
- Pin 4: Q424
- Pin 5: Q426
- Pin 6: Q454
- Pin 7: Q458
- Pin 8: GND
- Pin 9: OPHOT_L
- Pin 10: OPHOT_R
- Pin 11: GND
- Pin 12: Q422
- Pin 13: Q462
- Pin 14: GND
- Pin 15: OPA_2_O
- Pin 16: OPA_1_O
- Pin 17: GND
- Pin 18: Q468
- Pin 19: GND
- Pin 20: Q458
- Pin 21: GND
- Pin 22: Q422
- Pin 23: Q462
- Pin 24: GND
- Pin 25: OPA_1_O
- Pin 26: OPA_2_O
- Pin 27: GND
- Pin 28: Q454
- Pin 29: GND
- Pin 30: Q424
- Pin 31: GND
- Pin 32: V_{EE}
- Pin 33: GND
- Pin 34: V_{CC}
