

.18 ohm 10 Watt

I need the values of these two parts

If anyone has a Dukane Model 1A911C PA Amp 100Watt, would you mind looking to see the value of the 10 Watt resistor and the Cap that I have pointed out in the picture. The marked values have been destroyed due to excessive heat. The resistor and cap are open and need replaced.

If anyone would take the time to look at their Dukane it would be a big help for me. Also I would like a Service Manual if you know where I could get one.
