

## RS100-8 TABAQ Adjusted

By setting the tuning of the enclosure higher, there will be more bass output, but the cost is the low end. Since the simulated drop between 400 – 600 Hz does not seem to be a problem in real life, the opening cross section could simply be doubled from 16 cm<sup>2</sup> to 32 cm<sup>2</sup>.

- + Better overall frequency.
- Losing 10 Hz in the low end.

### Standard TABAQ

### Standard TABAQ with larger cross section in the opening (now 32 cm<sup>2</sup>)
