Assembly guide

The TWTMC-AIO is a dual Driscoll crystal oscillator suitable for digital audio with power supply on-board.

The TWTMC All in One is supplied as a finished device or as a bare PCB board.

The finished board is only available for two fixed frequencies: 22.5792 MHz and 24.576 MHz. The board is supplied with HC-49/U AT-Cut crystals from TFC, but can be upgraded to Laptech HC-43/U AT-Cut crystals. Power supply and output connectors are not provided.

The bare board can accommodate fundamental and overtone AT-Cut and SC-Cut crystals and can be used for frequencies from 5 MHz up to 100 MHz.

It needs 1 external power supply: unregulated or pre-regulated 9 to 12 VDC. Two connector options are provided for power supply: header screw terminal block or pin strip.

Output voltage is fixed at 3V3. Duty cycle is fixed at 50%.

The board provides 2 outputs, one for each frequency, with different connectors: SMA, u.fl or pin strip.

Finished board

The output connectors have to be chosen within 3 possible options, see BOM. Optionally the finished board can be supplied with soldered output connectors.

The power supply connector have to be chosen within 2 possible options, see BOM. Optionally the finished board can be supplied with soldered power supply connector.

Bare board

The components value indicated in the BOM are for 22.5792/24.576 MHz oscillators. If you are planning to build the oscillators for different frequencies, please see TWTMC-D Assembly manual for components value.

Resistors R11 and R31 have to be chosen to get around 3V between the collector of Q1/Q11 and ground. Firstly solder a 50K trimmer resistor in place of the resistors and adjust it to get the right voltage value. Then remove the trimmer resistor, measure its resistance and replace it with suitable resistors (the closest value as possible).

Finished board

Bare board
