

Tang Band W3 2141 sims by Bjørn Johannesen, MJK Model

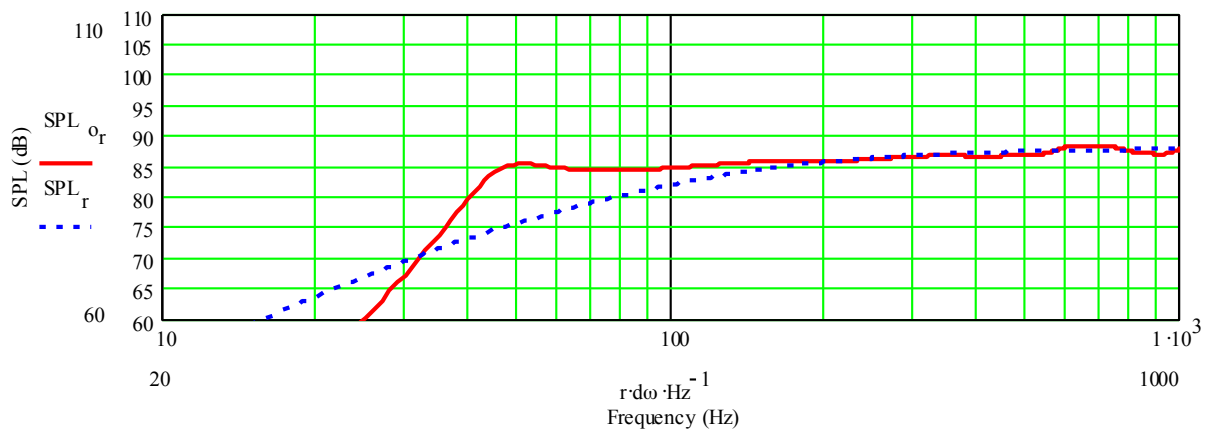

Standard TABAQ

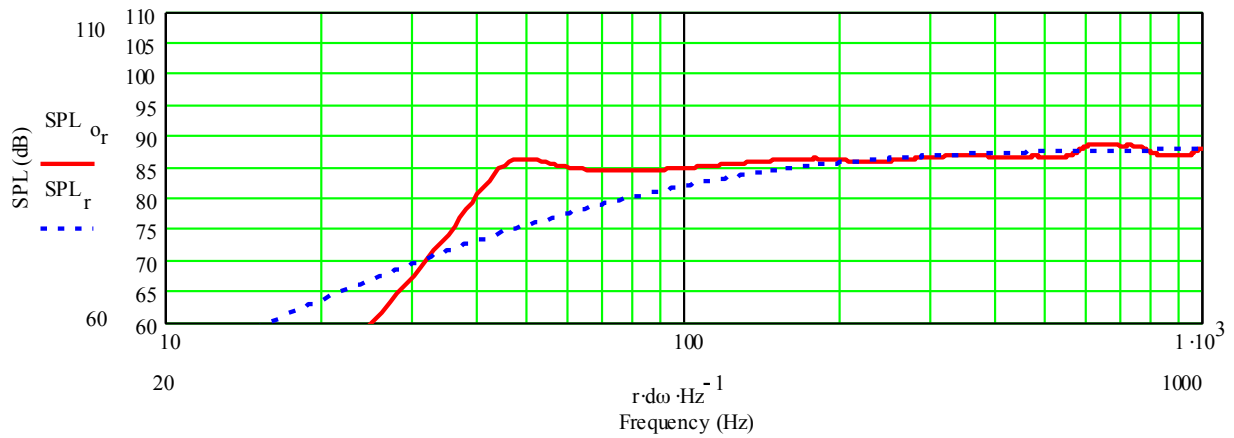

There is a hump around 60 Hz. I am not sure how auditable this will be in real life.

Lower tuning

If you tune the enclosure lower, the hump is dampened. The line has been extended by 3 inch, the port is 5 inch with same area / cross section. Stuffing is 100 gram.

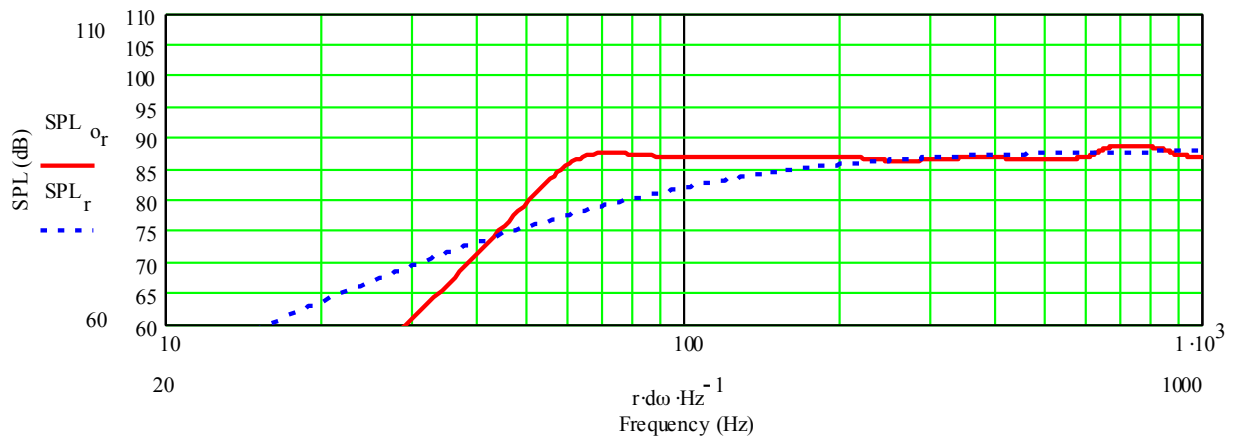

With 70 gram stuffing.

Standard TABAQ with reduced volume

Length and port is the same. Cross section has been reduced to 96 cm²

Stuffing is 75 gram.

I have not tested any of these, nor have I heard the driver. For this driver, I would go for the last example – the one with reduced volume.

Have fun !

Bjørn Johannesen
