

# X-Altra MC/MM Test Waveforms

These are the waveforms measured at the X-Altra MC/MM output with a 5mV input on the MM input unless otherwise stated.

The system gain stage was set to 0 dB. The rumble filter was switched OUT for these tests unless otherwise noted.

You can compare the output of your build to these waveforms to ensure yours is operating correctly.

The amplitude difference between channels should not be more than 2%, with <1% the norm.  
(Please note the waveforms are a bit noisy due to the quick bench lash-up)
